### Product Description

#### Spatula Stainless Steel - Scientific Equipment

A laboratory spatula is used for mixing, spreading and holding chemicals in a laboratory. In most cases, spatulas are made of stainless steel to prevent corrosion and provide clean mixing. However, certain spatula implements are made using rubber and polymers such as nylon.

#### Uses -

A spatula is a hand-held tool that is used for lifting, flipping, or spreading.

Spatulas have a handle that is long enough to keep the holder's hand away from what is being lifted or spread, as well as away from a hot surface.

The blade of the spatula is wide and thin.

#### **Available in size - 6", 8" Feature -**

Flat at one end.

And spoon at other end.
